

Health monitoring of rat colonies can be conducted through a combination of pathology, serology, microbiology, parasitology and PCR. In quarantine situations, PCR panels can be paired with serological tests to provide deeper insights into previous, inactive infections when importing animals.

We provide different health monitoring programs for quarterly or yearly monitoring according FELASA recommendations and more. Also, any kind of custom monitoring is possible.

Different sample types can be used for the different diagnostic procedures:

S - Serum
BS - Blot spot
T- Tissue
F- Feces

DS - Dry swab
MS - Microbiology swab (medium swab)
DSS - Deep skin scrape
FS - Fur swab
